

# WORK FLOW OF INFO HUB APPLICATION

This illustrates the workflow and key processes in the AI Driven Assistant and User Interaction System.

## 1. User Interface

## 2. Text-to-Audio Conversion

### 3. Audio-to-Text Conversion

### 4. AI Learning Assistant

## 5. AI Tools Module

## 6. Prompting Zone

## 7. Mental Health Prediction

## 8. User Input and Response Display

Prompting

Common non-chatbot AI tools and precise step-by-step instructions on how to use each.

**Image Generation (e.g., Stable Diffusion, DALL-E, Midjourney)**

1. Open the image tool UI (web app or plugin). Sign in if required.
2. Choose style & resolution: select art style, aspect ratio, and desired image size.
3. Write a concise prompt: include subjects, colors, mood, and any negative prompts (what to avoid). Example: 'A pastel-color portrait of a smiling child in a sunflower field, cinematic lighting, photorealistic.'
4. Generate and iterate: create multiple variations. Use seed and tweak prompts until satisfied.
5. Refine with edits: use inpainting or edit tools to change parts of the image, or rerun prompt with adjustments.
6. Download and license-check: download the high-res image and check the tool's usage/licensing policies before commercial use.

**Text-to-Speech (TTS) — (e.g., Amazon Polly, Google TTS)**

1. Open the TTS tool and choose the voice and language.
2. Paste or type your text; for long texts, split into sections to avoid timeouts.
3. Adjust speech settings: speed, pitch, emphasis or SSML tags if supported.
4. Preview speech and iterate until the pronunciation and intonation are correct.
5. Download the audio file (MP3/WAV) and test in your target player.
